# ABOUT TECHKING

## VISION

Become a leading mining and construction tire brand

## VALUE

Customer-oriented,  
Cooperate with Synergy,  
Improve with Consistency,  
Do with Responsibility,  
Behave with Integrity

## RECOGNITION FROM OE & BIG USERS

Established in 2007, Techking Tires Limited is dedicated to mining and construction tires, focusing on specific application, integrated product R&D, quality control, and brand operation. Our goal is to become a leading mining and construction tire brand.

Techking focuses on both domestic and overseas markets throughout development. Currently, it works with mining and construction companies in more than 100 countries and supports world-renowned mining enterprises and equipment manufacturers with quality service. By now, Techking is the only Chinese tire brand to simultaneously render all terrain crane tire services to China's top 3 crane manufacturers XCMG, SANY, and ZOOMLION. In the overseas markets, Techking renders tire services to more than 40 internationally recognized machinery manufacturers such as Liebherr, Tadano Demag, and JCB. It also gains the recognition of global leading mining companies including Rio Tinto, Glencore, BHP, and Vale.

Focusing on customer value, Techking is developing a Three-level core competitiveness that covers a localized marketing system, an integrated product development system, and a specialized service system. With the continuous support of technical talents and technological innovation, the company will deeply cultivate mining and construction industries, and provide our customers with application-specific products and professional services.

## APPLICATION VEHICLE MATCHING CHART

Application	Vehicle
Earthmover Service	Dump Trucks, Motor Scrapers, Articulated Dump Trucks, Coal Haulers, Logging Trucks, Other Mining Trucks, etc
Grader Service	Motor Graders
Loader & Dozer Service	Shovels, Front-End Loaders, Back-hoe Loaders, Skid Steer Loaders, Dozers, Shuttle Trucks, Load-Haul-Dumps, etc
High-Speed Service	All-Terrain Cranes, High-speed Vehicles, etc
Industrial Service	Straddle Carriers, Aircraft Towing Tractors, Container Stackers, Counter-balanced Lift Trucks, Mobile Crushers, Log Stacker, etc
Logging Service	Log-Skidders
Compactor Service	Compactors, Road Rollers
Sand Service	Sand Service Trucks

## TKPH/TMPH DEFINITIONS

### 1. TIRE TKPH OR TIRE TMPH

A tire's TKPH (TMPH) depends on its design and varies according to size and type. TKPH is a function of load and the number of kilometers (miles) covered per hour at an ambient temperature of 38°C or 100°F. The formula to convert a TKPH rating to a TMPH rating is:  $TMPH = TKPH \times 0.685$ . TMPH calculation is based on the "short ton" which corresponds to 2000 lbs or 907 kg.

### 2. BASIC SITE TKPH OR TMPH

This value reflects the specific requirements of a site and can be obtained by using the following formula:  
**Basic site TKPH (basic site TMPH) =  $Q_m \times V_m$**  where  $Q_m$  = average load per tire  
 $V_m$  = average cycle speed, in km (or miles) per hour

a) Average load per tire ( $Q_m$ )  
 Average load per tire ( $Q_m$ ):  $Q_m = (Q_c + Q_v) / 2$   
 where  $Q_c$  = the load per tire in ton (TKPH), or in short ton (TMPH), on a laden vehicle.  
 $Q_v$  = the load per tire in ton (TKPH), or in short ton (TMPH), on an unladen vehicle.  
 The  $Q_m$  calculation should theoretically be made for each tire. However, in practice, specific tire loads are not normally available and therefore this leads to the assumption that each tire on the same axle carries an equal load. When calculating the average load per tire on the front and the rear axles, the greatest value of  $Q_m$  shall be used in TKPH (TMPH) calculation.  
 In most cases, on two-axle dump trucks, the distribution of the total load of the loaded vehicle (unladen weight + payload) corresponds to 33.3% on the front axle (single tires) and 66.7% on the rear axle (twinned tires).  
 When unladen, the front axle is almost always the heaviest.  
 Thus, the maximum  $Q_m$ , will nearly always be on the front axle.  
**Caution: ensure that load distribution Front/Rear is even.**  
 Of course, the analysis of the site (or at least, the collected information), weighings and machine characteristics, will provide the information to define and check the load per tire.  
 b) The number of km (or number of miles) covered on the reference cycle:  
 This is obtained by using the relationship:  $V_m = L / H$   
 where  $L$  = the cycle length in kilometers (TKPH), or in miles (TMPH).  
 The reference cycle must be the one with the highest average speed.  
 $H$  = the duration of cycle in hour.

### 3. REAL SITE TKPH OR REAL SITE TMPH

The  $Q_m \times V_m$  formula is used to calculate the basic site TKPH (or TMPH).

To obtain the real site TKPH (or TMPH), two more factors must be taken into account:  
 - the length of cycles exceeding 5 kilometers (or 3 miles)  
 - the ambient temperature.

a) Cycle length – K1 coefficient  
 For cycle lengths exceeding 5 kilometers (or 3 miles) apply to the basic site TKPH (or basic site TMPH) the K1 coefficient, the values of which are given on page 110.

b) Site ambient temperature (TA) – K2 coefficient  
 The standard ambient temperature is 38°C (100°F). For a given speed, a site temperature higher than 38°C increases the real site TKPH (or TMPH). Conversely, a temperature lower than 38°C decreases the real site TKPH (or TMPH).  
 The K2 coefficient to apply to the basic site TKPH (basic site TMPH) comes from:

$K2 = \{V_m + [0.25 \times (TA - TR)]\} / V_m$  where  $V_m$  is the reference cycle average speed  
 $TA$  is the ambient temperature  
 $TR$  is the reference temperature (38°C or 100°F)

(\*: use 0.086 instead of 0.25 when calculating basic site TMPH)  
 The ambient temperature of the site (TA) to be taken into account is "the maximum temperature in the shade" during the hottest period.  
 For temperature TA greater than 15°C (59°F), use the K2 coefficient shown on page 32.

For temperature TA lower than 15°C (59°F), use the K2 coefficient shown in the shaded area of the table on page 32.

To sum up, for the real site TKPH (TMPH) calculation, proceed as follows:

- calculate the basic site TKPH (TMPH).
- calculate the correct for cycle length exceeding 5 kilometers (3 miles) by applying the K1 coefficient.
- calculate the correct for ambient temperatures not equal to 38°C (100°F) by applying the K2 coefficient.

**Real site TKPH (or TMPH) = Basic site TKPH (or basic site TMPH) × K1 × K2.**

## MAIN FACTORS TO BE CONSIDERED WHEN CALCULATE THE TKPH(TMPH)

## LOAD & CARRY OPERATIONS FOR LOADERS

Service condition of a loader is defined as "picking up material and relocating a short distance away, a maximum of 76m(250 feet), one way, with a maximum speed of 10km/h(5mph)". However, a loader can pick up a load and transport such load to another location and return unloaded for a longer distance. This type of service is called Load-and-Carry operations.

Transportation usually occurs at low speeds, up to 25km/h(15mph) with limited distance.

The tires when in Load-and-Carry operations may encounter heat problems especially on the front axle tires. To avoid such problems, Techking recommends the following operating conditions.

For tires over 33" inch rim diameter careful study is required to maximize tire life while considering TKPH. Please consult a Techking representative for more information.

If you need to use the tire beyond this recommendation, please consult a Techking representative.

TRA Code	Inflation pressure			Maximum round Distance(m)	Allowed average speed(km/h)
	Rim Diameter				
	29 inch and below		33 inch and below		
	Conventional Size (95 series)	Wide base size (80,65 series)	Wide base size (65 series)		
L2,L3	★	★★	★	1800	16
L4	550kpa (80psi)	825kpa (120psi)	600kpa (87psi)	1200	14
L5		500kpa (73psi)	625kpa (94psi)	1200	6
L5S			750kpa (109psi)		5

Shovels, Loaders, Bulldozers

## O-RING DEFINITION & SPECIFICATIONS

O-Ring: An O-shaped rubber ring used in earthmover tubeless tire mountings to seal air between the loose taper seat and the rim base.

### Note:

1. If the ambient temperature is over 38°C, or the max speed exceeds 50 km/h (or 30 mph), or the haul length exceeds 6 km one way, please consult a Techking Representative.

2. Techking Tire Compound Symbol

C1 = Cut Resistant. Resistant to cut, tread tearing and abrasion on rough surface. (mainly for mining, quarry area, loader, dozer and truck application)

CS = Cut and Speed compound. The cut resistance compound which also considers speed requirement, for rigid dump truck application at most scenario.

R1 = Standard Compound. Compromise solution between abrasion resistance and average speed on well maintained road.

(mainly for articulated dump truck, loader & dozer application in construction area)

H2 = Heat Resistant. For running on long cycles at high speed on well maintained road. (mainly for rigid dump truck application)

HS = Heat and Speed Compound. Designed for high ambient temperature, good road condition and high speed requirement.

H1 = High Speed Compound. Very high heating resistance at high speed on long cycles run on well maintained road. (mainly for mobile crane application)"
